

QUICK START

StageDesk v2026

Save My Time

Transfer labels and essential settings between audio consoles and software.

One source. One working table. One destination. StageDesk avoids retyping and adapts each transfer to the selected model.

Retrieve

Choose a displayed source mode, then open the offered project file and state.

Convert

Edit labels, colours, icons, and essential settings in one common grid.

Transfer

Use the mode and target state actually offered by the connector.

Windows x64 - macOS - Français and English - v2026 edition

----[]--

The three-step workflow

1 Retrieve Choose the source, model, then the source mode and state actually offered.	2 Edit Review the universal table and adjust only the data that should change.	3 Send Choose the target, then one of the modes actually shown for that profile and one of its offered target states.
---	--	---

Step	Fast action
1. Retrieve	System > Model > displayed source mode > offered file or Current state > Import.
2. Edit	Exclude unused channels, edit labels, and use Copy / Paste or smart fill.
3. Send	System > Model > one of the modes shown for this profile > offered target > Export.

The table follows the imported project. Parameters actually retrieved and transferable are selected under Details; absent or unsupported fields remain unselected. Only Include is visible during normal use.

New project

- Choose the parent folder and enter the project name.
- Name the first scene or snapshot when StageDesk asks for it.
- Use only the New Project modes offered for the selected profile.
- Export. StageDesk shows the path and summary; Nuendo and Harrison add detailed opening steps.

Existing project

- Choose the target project and one of its offered states; create a new state only when that action is displayed.
- In Existing Project mode, StageDesk replaces the selected file only after confirmation and creation of a same-folder, non-timestamped backup prefixed Bckp_, then Bckp2_ if needed.

Review before use

Check	Expected
Source	Correct project and correct scene or snapshot.
Table	Coherent channel count; unused channels excluded.
Target	Exact model, sufficient capacity, correctly named destination.
Adaptation	Colours, icons, and labels replaced with compatible values.
Readback	Project opened in the official editor and representative channels reviewed.

StageDesk creates and saves its own standalone .smtshow projects or Local StageFlow .stageflow projects. A joined StageFlow LIVE session applies valid external changes immediately without recalling the snapshot; same-field conflicts keep the local value and remain flagged.

For Nuendo, use File > Import > DAWproject. Avantis and dLive feed Current or snapshots and can create a snapshot or New Project for the chosen model. For DCE, select the XML machine and its Rx side; existing Tx channels are preserved.

Before using a production console, keep the previous validated show and test the exported copy offline.

Update

Help > Check for updates downloads the appropriate official package, checks its SHA-256 value, then opens its location.
